Wow, there sure are a lot of backbiting, contentious replies in this thread! Most of you need to chill. Dr Haley developed this supplement especially for ASD. He said if the FDA didn't (I'm not sure what word to use here since some are so particular about the word "approved" by the FDA) agree that OSR is safe for humans, that he would publish the recipe on his website and we could all make it in our kitchens. He wants to help people so strongly and he is so convinced about the safety of OSR that he would forgo all profits as the OSR developer as long as people could have it. I have not seen such a pure motive by anyone in years!

Haley first started with goldfish to test the toxicity of many different possible compounds. He added it to their water. If they survived he did further testing. The one he selected, isophthalamide, is fat soluble I believe. Note that heavy metals accumulate in the fatty tissues of our body. To make it water soluble to increase absorption he added two molecules of glutathione (GSH) which I believe is our bodies' main antioxidant.

Haley is working on an article to satisfy everyones desire for the facts on his scientific studies on OSR. My limited knowledge comes from two conferences where he spoke. These were the most recent IABDM and IAOMT meetings. Yes, both biologic/holistic/alternative dentist meeting. These dentists have learned a great deal about heavy metal poisoning because our profession is responsible for the main source of mercury poisoning in the population from mercury amalgam fillings. We learn how to properly and safely remove them.

Dr Haley said that GSH levels quadruple in the test animals. The first animal he tried it on was his nearly dead elderly cat. His cat is now running around like a kitten. He also treated cats that were poisoned with melamine, the Chinese pet food poison. For instance two cats from one family were poisoned and Haley only treated the cat that was worse. It fully recovered. The cat with much fewer symptoms was not treated and went on to eventually die.

He said that rats were injected with six times the lethal dose of mercury. If not treated they would die in six hours. If given OSR, they totally recovered with only a few symptoms for a day or two.

He gave some animals I believe 1000 times the recommended dosage of OSR for extended time periods. They were then sacrificed and tissue samples examined by a pathologist. No organ damage or neoplastic changes were seen in any areas of their bodies.

My whole family is taking it and I believe it is the most significant nutritional supplement in decades. For many reasons, some legal, many things can't be said about nutritional supplements. No one should make any health claims about OSR. Please understand, if this was approved as a drug, very few of us would be able to afford it. You really don't know how selfish you sound when you complain about less than \$2.00 per day for an adult dose. Have you seen the price of some pharmaceuticals these days? I think some are \$1000 a month or more.

OSR will be available in capsules, but for now it's only available in powder form. It has a slight sulfur smell when consumed in water. Add it to juice and it's no problem to take. Or mix it in some organic peanut butter. Also, at this time no measuring scoops are available yet. 100mg is about 1/16 tsp. Half this dose for people 55lbs and under.

As soon as Haley sends me his article I will try to scan it on this site.

My website is www.totalmouthfitness.com Click on news, then call my staff if you would like to buy some.

May God Bless,
Paul G Wilke DDS
